

### **Wood Shutters**

Wood shutters will shut out most of the light. The louvers on wood shutters close tighter than other horizontal blinds, but there will still be small light gaps between louvers and panels, letting in a small amount of light. Due to the nature of wood, no piece of lumber is absolutely straight. Our shutters meet a woodworking-manufacturing tolerance standard of 1/8" per lineal foot for bowing/warping. Louvers and other components will not be replaced if they fall within these standards. Sunburst or fan shutters are designed for beauty and the aesthetic filtering of light. When in the closed position, they will provide general privacy but will not provide uniform light control. Light will pass through these spaces and may filter unevenly. This again is most noticeable on windows exposed to direct sunlight. Due to the dimensional strength of the "tilt rod", all louvers **will not** necessarily close completely and uniformly while pushing on one location of the "tilt rod." This factor is compounded as the height of each panel increases.

### **Care Instructions**

Like any piece of furniture, dust your shutters regularly. Use an ordinary soft, clean cloth, dusting mitt or vacuum cleaner with a brush attachment.

### **Warranty Information**

The Seller grants to the original purchaser a lifetime warranty against **manufacturing defects**. Painted or Stained Finishes are warranted for two years.
